Cooling Method: Rapid quenching, usually in water or polymer solutions, to lock the microstructure in a supersaturated state.

Quenching

Purpose: Rapid cooling to retain the alloying elements in solution, preventing premature precipitation.

Methods:

- Water quenching (fastest and most common)
- Polymer or oil quenching (if component sensitivity requires gentler cooling)

Considerations:

- Quenching must be uniform to avoid residual stresses.
- Proper fixturing and agitation help achieve consistent cooling.

Aging Treatments

Aging is a critical step that precipitates strengthening phases within the alloy.

Types of Aging:

- Natural Aging: Performed at room temperature over weeks; suitable for some applications but yields lower strength.
